

Integrating Suricata with Wazuh

By Kritij Aman Mandal

Integrating Suricata with Wazuh

Introduction

Intrusion Detection Systems (IDS) and Intrusion Prevention Systems (IPS) are essential components in a layered cybersecurity strategy. These systems inspect network traffic for known and unknown threats to help detect and mitigate attacks.

1 IDS vs. IPS Overview

- **IDS (Intrusion Detection System):**
 - Detects threats by inspecting traffic using:
 - * Signatures (rules)
 - * IoCs (hashes, domains, URLs, TLS/SSH fingerprints)
 - * Lua scripting
 - Generates alerts and logs but does not block traffic.
- **IPS (Intrusion Prevention System):**
 - Takes proactive action by dropping or allowing traffic based on inspection results.

2 About Suricata

Suricata is an open-source network threat detection engine capable of functioning as both an IDS and an IPS. It is widely used in enterprise and government environments.

- By default, Suricata runs in IDS mode and logs suspicious traffic.
- In IPS mode, it can block malicious packets in real time.

3 Setting Up Suricata on Windows

3.1 Download and Install

1. Visit: <https://suricata.io/download/>
2. Download the Windows installer (.msi)
3. Run the installer with default settings

Suricata installs to:

```
C:\Program Files\Suricata\
```

Contents include:

- suricata.exe – the main executable
- suricata.yaml – configuration file
- rules\ – rule files directory
- log\ – log output folder

3.2 Install and Verify Npcap

Suricata requires Npcap to capture network traffic.

Step 1: Download from <https://npcap.com/#download>

During installation:

- Enable WinPcap API-compatible mode
- Enable startup at boot

Step 2: Verify that Npcap is running:

```
Get-Service -Name npcap
```

Expected output:

```
Status Name DisplayName
-----
Running npcap Npcap Packet Driver (NPCAP)
```

If not running:

```
Start-Service -Name npcap
```

4 Configure Suricata

Open Configuration

C:\Program Files\Suricata\suricata.yaml

Define Network Interface

To view interfaces:

Get-NetAdapter | Select Name, Status

Example config snippet:

```
af-packet:  
- interface: Ethernet
```

Add Rule Files

In suricata.yaml, locate and update:

```
rule-files:  
- local.rules  
- emerging-all.rules
```

Make sure emerging-all.rules exists in the rules\ folder.

Enable JSON Logging

Enable EVE JSON output:

```
outputs:  
- eve-log:  
  enabled: yes filetype:  
  regular filename: eve.json
```

```
# Extensible Event Format (nicknamed EVE) event log in JSON format  
- eve-log:  
  enabled: yes  
  filetype: regular #regular|syslog|unix_dgram|unix_stream|redis  
  filename: eve.json  
# Enable for multi-threaded eve.json output; output files are amended with
```

Figure 1: Figure 1: JSON logging configuration in suricata.yaml

5 Running Suricata

In PowerShell (Admin):

```
cd "C:\Program Files\Suricata\" suricata -c  
suricata.yaml -i <interface>
```

Replace <interface> with your adapter name.

Suricata Log Files

```
C:\Program Files\Suricata\log\
```

Important files:

- eve.json – JSON alerts
- fast.log – quick alerts
- stats.log – system stats

6 Integrating with Wazuh SIEM

Step 1: Confirm EVE JSON Output

Ensure Suricata is writing logs to:

```
C:\Program Files\Suricata\log\eve.json
```

Step 2: Configure Wazuh Agent

Edit:

```
C:\Program Files (x86)\ossec-agent\ossec.conf
```

Add:

```
<localfile>  
<log_format>json</log_format>  
<location>C:\Program Files\Suricata\log\eve.json</location>  
</localfile>
```

```
<localfile>  
  <log_format>json</log_format>  
  <location>C:\Program Files\Suricata\log\eve.json</location>  
</localfile>
```

Figure 2: Figure 2: Wazuh Agent config for EVE JSON

Step 3: Restart the Wazuh Agent

Restart-Service -Name wazuh

Step 4: Generate Alerts

Use test traffic such as:

ping google.com

Step 5: View Alerts in Wazuh

- 1. Open Wazuh Dashboard
- 2. Navigate to **Threat Hunting**
- 3. Filter by Suricata

The screenshot shows the Wazuh Threat Hunting dashboard. At the top, there's a header with 'W.' and 'Threat Hunting'. Below it, a date range 'Aug 1, 2025 @ 16:21:19.110 - Aug 2, 2025 @ 16:21:19.110' is displayed. A table of alerts is shown with columns: timestamp, agent.name, rule.description, rule.level, and rule.id. The table contains 6 rows of alerts, all from 'MyPc' agent, with rule ID '86601' and rule level '3'. The rule description for all is 'Suricata: Alert - TEST - ICMP ping detected'.

timestamp	agent.name	rule.description	rule.level	rule.id
Aug 2, 2025 @ 16:13:27.582	MyPc	Suricata: Alert - TEST - ICMP ping detected	3	86601
Aug 2, 2025 @ 16:13:27.518	MyPc	Suricata: Alert - TEST - ICMP ping detected	3	86601
Aug 2, 2025 @ 16:13:27.391	MyPc	Suricata: Alert - TEST - ICMP ping detected	3	86601
Aug 2, 2025 @ 16:13:27.375	MyPc	Suricata: Alert - TEST - ICMP ping detected	3	86601
Aug 2, 2025 @ 16:13:26.883	MyPc	Suricata: Alert - TEST - ICMP ping detected	3	86601
Aug 2, 2025 @ 16:13:26.772	MyPc	Suricata: Alert - TEST - ICMP ping detected	3	86601

7 Conclusion

Suricata is a powerful, flexible IDS/IPS that integrates easily with Wazuh for centralized visibility and alerting. With the proper configuration, your Windows environment gains advanced network monitoring capabilities with open-source tools.
